## SIZING GUIDELINES

For New or Replacement Sewage Pumps

Sump and Sewage Pump Manufacturers Association

## CONTENTS

- Pump Capacity How much flow do you need?
- Total Dynamic Head (TDH) of the installation
- Solids-Handling Requirements
- Basin Selecting the right size
- Simplex or Duplex System?
- Sizing Example

## PUMP CAPACITY

- Refers to the rate of flow in gallons per minute (GPM) which is necessary to efficiently maintain the
 system.

Most practical approach to determine this figure is the Fixture Unit method. This method assigns a relative value to each fixture, or group of fixtures that flow into the pump system.

## Pump Capacity

## To determine the required PUMP CAPACITY, follow these 2 steps:

## Step 1: Determine Total Fixture Units

Step 2: Find resulting Pump Capacity

## Step 1

List all fixtures involved in the installation and, using Figure A, assign a Fixture Unit value to each. Determine the Total Fixture Units.

| Fixture Description | Fixture <br> Unit Value | Fixture Description | Fixture <br> Unit Value |
| :--- | :---: | :--- | :---: |
| Bathtub, 1 1/2" trap | 2 | Sink, service type | 3 |
| Bathtub, 2" trap | 3 | Sink, scullery | 4 |
| Bidet, 1 1/2" trap | 3 | Sink, surgeons | 3 |
| Dental unit or cuspidor | 1 | Swimming pool (per 1000 gal) | 1 |
| Drinking fountain | 1 | Urinal | $4^{* *}$ |
| Dishwasher, domestic | 2 | Washing machine | 2 |
| Kitchen sink | 2 | Water closet | $3^{* *}$ |
| Kitchen sink with disposal | 3 | Water softener | 4 |
| Lavatory, 1 1/2" trap | 2 | Unlisted fixture, 1 1/4" trap | 2 |
| Lavatory, barber/beautician | 2 | Unlisted fixture, 1 1/2" trap | 3 |
| Laundry tray | 2 | Unlisted fixture, 2" trap | 4 |
| Shower | Unlisted fixture, 2 1/2" trap | 5 |  |
| Shower, group (per head) | 3 | Unlisted fixture, 3" trap | 6 |
| Bathroom group consisting of lavatory, bathtub or shower, and water closet | $6^{* *}$ |  |  |
|  |  |  |  |
| *Graph data taken from Aspe Handbook, Uniform Plumbing Code, Cameron Hydraulic Data and Plastic Pipe Institute. |  |  |  |
| ** Add 4 fixture units for each flush valve fixture |  |  |  |

## Step 2

- Refer to Figure B, locate the total Fixture Unit amount along the horizontal axis of the graph. Follow vertically along until the intersecting plotted line. Follow this intersection point horizontally and read the PUMP CAPACITY in GPM on the vertical axis.

## Pump Capacity based on total Fixture Units

FIGURE B

## TOTAL DYNAMIC HEAD (TDH)

TDH is a combination of Static Head and Friction Head and is expressed in feet.

## TDH = Static Head + Friction Head

- Static Head is the actual vertical distance measured from the minimum water level in the BASIN to the point of discharge. Refer to Figure C.

## Static Head

FIGURE C

## CAUTION!

The point of discharge may not be the highest point in the piping system. A pump must be selected that has a shut-off head greater than the highest point in the pipe system.

FIGURE C

## Friction Head

## Step 1 in calculating Friction Head

- First determine the discharge pipe size.

" 2" or 3" diameter is common on solids-handling sewage applications in residential / light commercial
- In order to ensure sufficient fluid velocity to carry solids (which is generally accepted to be 2 feet per second), the following are minimum required flows - even if the GPM required for the fixture units is less.

## MINIMUM FLOW REQUIREMENTS

2 feet per second =

- 21 GPM through 2" pipe
- 46 GPM through 3" pipe
- 78 GPM through 4" pipe

If you don't have these minimums you won't move the solids!

## Step 2 in calculating friction head

- The length of the discharge piping is measured from the discharge opening of the pump to the point of final discharge, following all contours and bends.

## Step 3

Friction factors for pipe fittings in terms of equivalent feet of straight pipe

| Nominal Pipe Size | 90 Elbow | 45 Elbow | Tee (Thru-flow) | Tee (Branch flow) | Swing Check Valve | Gate Valve |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2" | (5.2) | 2.8 | 3.5 | 10.3 | -17.2 | 1.4 |
| 2 1/2" | 9.2 | 3.3 | 4.1 | 12.3 | 20.8 | 1.7 |
| 3 " | 7.7 | 4.1 | 5.1 | 15.3 | 25.5 | 2.0 |
| Consider all fittings - elbows, gate valves, check valves used in the installation <br> (2) $\ldots . .2$ " 90 degree elbows $=5.2 \times 2$ elbows in our example $=10.4$ feet of pipe |  |  |  |  |  |  |

Now add this 28' (equivalent feet) to the existing 200' length of discharge piping for a total of 228'.

Refer to Figure E. Using the required PUMP CAPCITY (GPM) in the left

## Step 4

 column, follow across to the number below the pipe size being used. This number represents the Friction Head per 100 feet of pipe. Multiply this number by the number of 100 ft increments to determine Friction Head.

# TOTAL DYNAMIC HEAD (TDH) IS? 

## $\mathrm{TDH}=$ Static Head + Friction Head

Static Head................. 7 Feet<br>+ Friction Head.............. 3 Feet<br>Total Dynamic Head...... 10 Feet

Now look at pump curves in Figure F..... At 10 feet of head, we need a pump that can give us a minimum of 22 GPM.

## Pump Selection

## Oversizing the Pump?

- The most efficient part of the curve is usually in the middle of the curve, away from maximum head or flow
- More horsepower or flow is not always better - especially in smaller basins.
- Short cycling may reduce the life of the pump. A longer pumping cycle will be better for pump longevity.

## SOLIDS HANDLING

## BASIN SELECTION

- Selection of the basin is best accomplished by relating to the required Pump Capacity as determined by the Fixture Unit method.
- Figure $G$ shows the recommended Basin Diameters assuming a pump differential of 8" (Distance between pump turn-on and turnoff).
- Other factors such as pump size, controls, and accessories may impact the required basin size.
- Basin depth should normally be at least 24 " for most pumps, and deeper where greater pumping differentials are anticipated.

## Recommended BASIN Diameters

## SIMPLEX OR DUPLEX

The question of whether to use a Simplex (one pump) or

Duplex (two pump) System depends on the type of installation and/or local codes requirements.

- Domestic/Residential Use:

Simplex System is adequate in most instances; however if entire residence is on the system, duplex may be required.

- Public/Commercial Use:

Duplex System is essential.

## Simplex or Duplex System?

Duplex systems make use of special controls in order to alternate the usage of two pumps. Duplex systems provide several advantages over Simplex systems:

- The pumps alternate and therefore share the load.
- The lag pump is activated in the event of failure or lockage of the lead pump.
- The second pump is activated along with the lead pump in instances of unusually high inflow.

## SIZING EXAMPLE

Using the pump curves from Figure F, fill out the Sewage Pump Sizing Worksheet and find a suitable pump to serve a 4 bathroom home, including a dishwasher, kitchen sink with disposal, washing machine, laundry tray, and a water softener.

- The Static Head is 15 feet
- The discharge pipe is 2 " diameter
- The discharge piping is 500 feet long
- The discharge piping will include (1) check valve, (3) 90 degree elbows, (2) 45 degree elbows, and (1) gate valve.

## Example: Pump Capacity

## Step 1: Determine Total Fixture Units

(Reference Figure A)

- (4) Bathroom Groups 6 Fixture Units each X4 = 24 Fixture Units
- (1) Dishwasher
= 2 Fixture Units
- (1) Kitchen sink w/ disposal
- (1) Washing Machine
- (1) Laundry Tray
- (1) Water Softener

Total
= 3 Fixture Units
= 2 Fixture Units
= 2 Fixture Units
= 4 Fixture Units
$=37$ Fixture Units

## Step 2

Pump Capacity based on total Fixture Units

## FIGURE B

## Example: Pump Capacity

## Step 2: Find resulting Pump Capacity

(Reference Figure B)
37 Fixture Units $=23.5$ Gallons per Minute
Minimum flow for $=21$ Gallons per Minute 2" diameter pipe

Minimum GPM $=23.5$ Gallons per Minute for this example

Round up to 24 Gallons per Minute

## TDH = Static Head + Friction Head = 22 feet

## Static Head $=15$ feet <br> Friction Head $=7$ feet

Friction Factors
(3) 90 degree 2 " elbows $=5.2 \times 3$
(2) 45 degree 2 " elbows $=2.8 \times 2$
(1) 2" Gate valve $=1.4 \times 1$
(1) 2 " Swing Check valve $=17.2 \times 1$

Equivalent feet
(Reference Figure D)
(1) 2" Gate valve $=1.4 \times 1$
(1) 2 " Swing Check valve $=17.2 \times 1$ 15.6
5.6
1.4

$$
+500 \text { ' straight pipe }=\quad 539.8 \text { equivalent } \mathrm{ft}
$$

$539.8 \mathrm{ft} \times 1.3 /$ per $100 \mathrm{ft}=7.02 \mathrm{ft}$. of friction head
